About the solution

DATANA

DATANA is BioSistemika's DNA-based digital data storage platform. It encodes digital files into synthetic DNA, the densest data storage medium in the world, capable of storing information at a density millions of times higher than hard drives or magnetic tape in a negligible physical footprint.

The result is an archival medium that is offline, immutable, energy-independent, and durable for millennia.

End-user

Data storage provider specialising in ultra-secure, critical data storage. These are companies that operate their own infrastructure and data centres, where their end customers store highly sensitive and mission-critical data on-site.

Funded by
the European Union

Initially, we want to position DATANA as a technology provider to these companies, offering DNA data storage as a service that they can integrate into their existing portfolio.

Rather than selling directly to end customers, we equip the storage provider with a new ultra-secure, offline, and immutable storage tier that complements their current offering and serves as the ultimate layer of protection for their most valuable data.
